10. Product Success Criteria
11. Summary
12. Sources and Verification

---

1. Product Overview

BuzzFest is a digital marketplace concept designed to connect customers with independent home bakers and make it easier to discover and browse homemade baked goods.

The platform brings product discovery and baker information into a single online experience. Customers can explore available products, review prices and product details, add items to a shopping cart, and place an order. The marketplace is intended to help independent bakers present their offerings to a wider audience while giving customers a convenient way to discover products from local baking businesses.

BuzzFest is currently a beta proof of concept. It is a sample project that demonstrates the customer-facing shopping experience from browsing through to order placement. A separate operations application for managing orders is planned but has not been started.

---

2. The Problem

Independent home bakers often operate on a relatively small scale. Their product discovery and customer communication may depend on social media, messaging applications, personal networks, or other fragmented channels.

These approaches can make it difficult for customers to discover available products, compare offerings, and navigate the purchasing process. For bakers, managing product information and customer orders across multiple channels can introduce additional administrative work.

BuzzFest aims to address these challenges through a more organised digital marketplace.

Customer challenges

- **Product discovery:** Finding independent bakers and exploring their products can require searching across multiple channels.
- **Product information:** Customers need a convenient way to view product details and prices before deciding what to purchase.
- **Shopping convenience:** A centralised browsing and cart experience can make product selection more straightforward.

Baker and operational challenges

- **Product visibility:** Independent bakers need a way to present their products in an organised, discoverable format.
- **Order coordination:** As order volumes grow, relying entirely on manual communication can become harder to manage.
- **Operational organisation:** A dedicated operations interface, planned for a later version, could handle orders and related workflows more systematically.

These challenges describe the product's intended problem space; the extent to which each is addressed by the current implementation is set out in Current Scope.

---

3. Target Users

3.1 Customers

Customers are people interested in discovering and purchasing baked goods from independent bakers.

Their primary needs include:

- Browsing available baked products.
- Exploring baker and product information.
- Understanding prices and availability.

- Selecting products and adding them to a cart.
- Moving through a clear and convenient shopping journey.

Customers do not need an account. In the current version, an order identifies the customer by email address and name.

3.2 Independent home bakers

Home bakers are the suppliers whose products form the marketplace's catalogue.

Their potential needs include:

- Presenting products and prices clearly.
- Making their offerings easier for customers to discover.
- Maintaining accurate product and availability information.
- Receiving and coordinating customer orders.

In the current version, bakers appear as profiles and product creators in the marketplace. Baker onboarding ("Join Us") is not available; the link on the site is a placeholder. Baker-facing tools, such as order acceptance, are intended for the planned operations application, which has not been started.

3.3 Marketplace operators (planned)

Marketplace operators would be responsible for supporting the platform's operational workflows.

Their needs may include:

- Reviewing and managing orders.
- Coordinating order fulfilment.
- Maintaining visibility into order status.
- Recording relevant operational changes.

This audience is served by the planned operations application. It is not part of the current version.

---

4. Product Goals

BuzzFest's product goals are to:

1. **Improve product discovery:** Give customers a central place to explore products from independent home bakers.
2. **Simplify product selection:** Present product information and pricing in a consistent, accessible format.

3. **Support a convenient shopping experience:** Provide a structured browsing and cart experience.
4. **Organise marketplace operations (planned):** Establish a dedicated interface for operational activities such as order management.
5. **Create a foundation for growth:** Use an architecture that can support additional marketplace capabilities as requirements evolve.

These goals guide the product's direction without assuming that every planned capability is already available.

---

5. Key Features

5.1 Product and baker discovery

The customer-facing application presents bakery products and associated baker information.

The site has three main pages: **Home**, **Our Bakers** and **About Us**. The home page groups products into the sections *Our Star Partners*, *In Demand* and *Guilt Free Indulgence*.

The marketplace currently features four Bangalore-based bakers:

Baker	Specialty	Location	Experience	Rating
Sandhya Mishra	Traditional Sourdough & Millet Breads	Indiranagar	Baker since 2012	4.9
Priya Sharma	Custom Fondant Cakes & Cupcakes	Koramangala	Baker since 2018	4.8
Meenakshi Iyer	South Indian Tea-time Snacks	Jayanagar	Baker since 2005	5.0
Ananya Das	Vegan & Gluten-Free Pastries	Whitefield	Baker since 2020	4.7

The sample catalogue supplied for this document contains 28 products across these bakers.

5.2 Product information

Each product listing can present:

- Name, description and price in Indian rupees (₹).
- A vegetarian indicator.
- Category tags, such as cake, cupcake, doughnut, bread, vegan, eggless or seasonal.
- A star rating and a stock count.
- One or more images.
- A "featured" flag, used to highlight selected products.

Clear product information helps customers evaluate their options before adding items to their cart.

The data model also supports product variants (a named option with its own price and stock). Whether the storefront currently offers variants to customers has not been verified.

5.3 Shopping cart

The application includes an **Add to Cart** interaction, and the site header shows a cart counter. Adding products to the cart works in the current version.

Detailed cart behaviour — quantity changes, item removal and persistence between visits — has not been verified and should be documented separately.

5.4 Checkout and orders

Customers can place an order. The current version works as follows:

- **Guest orders.** An order records the customer's email address (required) and name (optional). There are no customer accounts.
- **Order record.** Each order has a unique order number, a total amount and a currency (INR by default).
- **Order items.** Each item records the quantity, the product name, the product image and the price at the time of purchase. Because these values are stored on the order, an order keeps its original details even if the product is later renamed or repriced.
- **Customisation.** An item can carry special instructions, a message (for example, a message for a cake), a size and a variant.
- **Order status.** Every order has a status, which starts as *Pending*. The available statuses are listed in 7.4 Order lifecycle.

How payment is taken (through a payment gateway, a simulated payment or not at all), and how an order moves from *Pending* to *Paid*, has not been verified.

5.5 Operations application (planned)

A separate operations application for order management is planned. It has not been started and is not part of this version.

The database schema already contains a task model: a task belongs to an order, can be assigned to a baker, and has a title, priority, due date, notes and a delay flag. This appears to be groundwork for the planned operations application. No interface for it has been built.

---

6. Key User Journeys

The journeys below describe the customer experience in the current version, followed by planned journeys that depend on the operations application.

Journey 1: Discover and select products

User: Customer

1. The customer opens the BuzzFest marketplace.
2. The customer browses available bakery products and baker information.
3. The customer reviews relevant product details and prices.
4. The customer selects a product.
5. The customer adds the product to the cart.

Desired outcome: The customer can discover a suitable product and begin assembling a selection for purchase.

Journey 2: Prepare for a purchase and place an order

User: Customer

1. The customer adds one or more products to the cart.
2. The customer reviews the selected items.
3. The customer checks quantities and applicable prices.
4. The customer proceeds to checkout and provides an email address (a name is optional), along with any special instructions or message for an item.
5. The customer places the order, and an order is created with the status *Pending*.

Desired outcome: The customer can review their selection and understand the next steps before committing to a purchase.

Payment, order confirmation and customer notifications have not been verified and should not be described as supported.

Planned journeys (require the operations application)

Journey 3: Manage an order

User: Marketplace operator

1. The operator accesses the operations application.
2. The operator reviews an order.
3. The operator performs the available order-management actions.
4. The operator tracks or updates the order as supported by the application.
5. The order progresses through the implemented operational workflow.

Desired outcome: The operator has a structured way to work with orders instead of relying exclusively on informal communication.

Journey 4: Fulfil a customer order

User: Baker and marketplace operator

1. An order is made available to the relevant operational workflow.
2. The responsible party reviews the order details.
3. The order is prepared and coordinated for fulfilment.
4. Its status is updated as the process progresses, where supported.

Desired outcome: The customer order can be coordinated from acceptance through fulfilment.

The allocation of responsibilities between bakers and marketplace operators, including any notifications or independent baker controls, remains to be defined.

---

7. Business Rules and Domain Assumptions

Business rules define how a product is expected to behave, independently of its user interface.

7.1 Orders and bakers

Each order item records the baker it belongs to. The data model does not restrict an order to a single baker, so a single order could contain items from several bakers.

How the current checkout assigns the baker to each item has not been verified. See Known Limitations.

7.2 Product pricing

Prices are stored as decimal amounts in Indian rupees, with two decimal places (for example, 150.00 means ₹150). They are not stored in paise.

The price paid is copied onto each order item at the time of purchase, so later price changes do not alter past orders. Customer-facing currency formatting is a separate presentation concern.

7.3 Product availability

Stock is stored as a count for each product, and separately for each variant. Stock levels are shown to customers.

In this beta, stock is **not enforced at checkout** and is **not reserved** when a product is added to the cart, so the same stock could be ordered more than once. Whether placing an order reduces the stock count has not been verified.

7.4 Order lifecycle

An order has one of six statuses:

Status	Meaning
Pending	The default status when an order is created.
Paid	The order has been paid.
Preparing	The order is being prepared.
Out for delivery	The order is on its way to the customer.
Completed	The order has been delivered or fulfilled.
Cancelled	The order has been cancelled.

The meaning of each status above reflects its name. The rules for moving between statuses (which transitions are allowed, who can make them, and what triggers them) are not defined in the database and have not been verified.

7.5 Customers and access

The data model has no user accounts or roles. Customers are identified on an order only by email address and name. No sign-in, authorisation or role-based access is part of the current version.

---

8. Current Scope

Available in the current version

- A customer-facing marketplace for discovering bakery products.
- Baker profiles (specialty, location, experience, biography, rating).
- Product listings with prices, ratings, stock counts and a vegetarian indicator.
- Add to Cart.
- Checkout and order creation, with guest customer details and per-item instructions and messages.
- Order records with a status field and prices captured at purchase.

Not available in the current version

- Baker onboarding ("Join Us"). The link is a placeholder.
- The operations application.
- Stock checks at checkout and stock reservation.
- Customer accounts and sign-in.

Requires implementation verification

- Cart quantity changes, item removal and persistence.
- Payment processing and the move from *Pending* to *Paid*.
- Order confirmation and customer notifications.
- Whether placing an order reduces stock.
- Product variants in the storefront.
- Order cancellation, refunds and returns.
- Delivery scheduling, tracking and completion.

Future opportunities

Potential enhancements include:

- Improved product search and filtering.
- More detailed baker profiles.
- Order notifications and status updates.
- Dedicated baker dashboards.
- Enhanced inventory management.
- Customer order history and repeat purchasing.
- Support for multi-baker checkout, if justified by business requirements.

These opportunities are not commitments to deliver specific features; they represent possible directions for future product development.

---

9. Known Limitations in This Beta

BuzzFest is a proof of concept with sample data. The following limitations are known:

- **"Join Us" is a placeholder.** It links to the same page as "About Us".
- **No stock enforcement.** Customers can order more than the stock shown.
- **No accounts.** Orders are placed as a guest.
- **No operations application.** Orders can be created but there is no interface to manage them.
- **Baker attribution on orders needs checking.** In the sample orders, all 8 order items record the baker "sandhya-mandi", although 5 of those products belong to other bakers. This may indicate that baker attribution is not yet implemented at checkout.
- **Sample data inconsistencies.** One baker has the name "Sandhya Mishra" but the identifier "sandhya-mandi", which also appears as the byline on product cards. The product "Very Berry" is priced at ₹1,009, well above similar items. Several products use the placeholder description "Chef special handcrafted item".

- **Browser tab title.** The site title is still the default "Create Next App".

---

10. Product Success Criteria

BuzzFest's product goals can be evaluated through measurable indicators as the marketplace matures.

Potential measures include:

- **Product discovery:** The proportion of visitors who view product details after opening the marketplace.
- **Cart engagement:** The proportion of visitors who add at least one product to their cart.
- **Purchase completion:** The proportion of initiated checkouts that result in successfully created orders.
- **Operational efficiency:** The time required to review and process an order, once the operations application exists.
- **Order fulfilment:** The proportion of accepted orders completed successfully within the expected timeframe, once the relevant workflow exists.
- **Customer experience:** Feedback on product discovery, shopping convenience, and order communication.

These are proposed measures, not claims about current performance. Baselines and targets should be established after analytics and operational tracking are available.

---

11. Summary

BuzzFest is a home-baker marketplace designed to make bakery products easier to discover and provide a structured shopping experience for customers. The current beta lets customers browse four Bangalore bakers and their products, add items to a cart and place an order, and it records each order with a status and the prices paid.

The product's value lies in bringing product discovery and ordering into a more organised digital experience. Its initial scope establishes a foundation that can evolve as customer needs, baker workflows, and operational requirements become clearer. The planned operations application, baker onboarding and stock management are the main areas still to be built.

This document provides the product-level overview. Detailed functional specifications, technical architecture, implementation status, and operational procedures should be maintained as separate documents and updated against the working application.

---

12. Sources and Verification

This document was checked against:

- The live site at https://buzz-fest.vercel.app/ (pages, navigation and product cards).
- The database schema (`schema.prisma`) and a view of the database tables.
- Sample data exported from the database: bakers, products and order items.
- Statements from the project owner on which features exist in this version.

Where a statement could not be checked against these sources, the document says it has not been verified.
